Setting up the Snackible marketing agents

A short guide for anyone. You do not need to be technical: Claude does the setup for you and tells you when it needs a click or an answer.

What you get

Two reports that arrive by email, with no one having to ask for them. Each email has the main points and a link to a Google Doc with the full report.

Report	When it arrives	What it tells you
Brand Health	Every morning	How Snackible's own products are doing: what is out of stock, prices, ratings, where Snackible shows up in Amazon searches. Starts with what needs attention today.
Competitor Research	Every Monday	What competitors changed this week: prices, offers, ads, ratings, new products.

Before you start

- A **computer you can leave on** in the morning, with the Claude app on it. The reports are made on that computer.
- A **Google account** with Drive and Gmail (your work account). The reports are saved in your Drive and emailed from your Gmail.
- The **Chrome** browser, if you want delivery-app prices (Blinkit, Zepto, Instamart). Everything else works without it.
- An internet connection. The agents are downloaded from a public page on GitHub (https://github.com/Snackible/Brand_Agents); you do not need a GitHub account.

Step 1: paste this to Claude

Open Claude, start a new chat, and paste the whole box below. Nothing else is needed.

> Please set up the Snackible marketing agents for me. The instructions are in the file called SETUP_FOR_CLAUDE.md at https://github.com/Snackible/Brand_Agents. Follow them step by step and do every step yourself. Explain each step in plain words, and ask me only when you need me to click something or give you an answer. I am not technical.

Step 2: say yes and click when Claude asks

Claude will work through the setup and stop only when it needs you. You can expect these, in roughly this order:

1. **Where to keep the files.** Claude suggests a folder in Documents. Say yes. Do not delete or move it later; the agents keep their history there.
2. **Permission to install two small helper programs** the agents use to read websites. Say yes once.
3. **Turning on Google Drive and Gmail** for Claude, if they are not on already. You click **Allow** on the Google screen.
4. **Adding the Claude in Chrome extension**, if you want delivery-app prices. You click **Add to Chrome**.
5. **Optional: signing in to a few sites in Chrome.** For Instagram post details and Amazon review themes, the agent uses the sign-in Chrome already has. If Chrome is not signed in, Claude tells you which sites and waits while **you** sign in. It never types your password or codes.

6 **One set of questions, asked once:** which email addresses should get the reports, whether to send them automatically or just prepare a draft, and what time. Claude repeats your answers back. Say yes, and it sets up the daily and weekly runs for you.

Claude never types your passwords, codes or CAPTCHAs. If something needs you to sign in, it tells you what to click.

Step 3: your first reports

Claude then makes the first two reports. This takes about five to ten minutes. Open the emails and check them. **The first report of each kind is a starting picture, not a list of changes.** Changes appear from the second one, so a quiet first report is normal.

After that

- The reports arrive on their own, at the times you chose. Nothing to do.
- **The computer has to be on, and the Claude app open,** at that time. If it was off, the report arrives the next time the app opens. This is the most common reason a report is late.
- To change who gets the reports or when, tell Claude: **Change report recipients** or **Change the report schedule**.
- To get improvements later, tell Claude: **Update the Snackible agents to the latest version from GitHub.**
- **If a report needs you** (a sign-in, Chrome closed, a connection turned off), Claude stops and asks you, every time, while you are at the computer. For scheduled runs nobody can answer, so the email starts with **ACTION NEEDED** and lists what to do, and Claude asks again the next time you open it.
- For the first two weeks, compare the reports with what the team already knows, and tell Claude if something looks wrong.

If something goes wrong

What happens	What to tell Claude
Claude cannot open the GitHub page	Open the page in your browser, click the green **Code** button, then **Download ZIP**, and tell Claude where the file was saved.
A report did not arrive	"The Snackible report did not arrive. Find out why and fix it." Usually the computer or the app was closed; it arrives when the app reopens.
Delivery-app prices are missing	"Check that Claude in Chrome is connected." Keep Chrome open when reports run.
Claude asks who gets the reports again	"Check that Google Drive is connected to the same Google account as before."
Anything else	"Run the setup check for the Snackible agents and fix whatever is missing."

Good to know

- Numbers come from public web pages. Each report ends with a list of anything that could not be read, so you can see what is missing.
- Not covered: BigBasket and Reddit (they block automated readers). Instagram posts and Amazon review themes are read only when Chrome is already signed in to those sites. A sign-in can expire; the report then says which site needs signing in again.
- Report owner: TODO (name). Check the first two weeks of reports before relying on them.
